Notes: 1. Long-term external debt is defined as debt payable to non-resident creditors with an original maturity of over one year; while short-term debt has a maturity of up to and including one year.

2. External public debt is defined as debt payable to non-resident creditors which is a direct obligation of, or has repayment guaranteed by, the public sector of the Republic of China (Taiwan). Beginning December 2004, the figures include the outstanding external debt balance of repurchase agreements (repos) involving securities engaged by the Central Bank. External private debt is defined as an external obligation of the private sector that is not guaranteed for repayment by the public sector.

3. The debt-service ratio represents payments of amortization and interest on external debt as a percentage of the exports of goods and services, and is based on debt service actually paid and not on contractual service due. Beginning 2004, debt-service payments comply to the World Bank's and IMF's current approach and comprise actual payments of interest on total external debt and actual amortization payments on long-term external debt. For periods prior to then, debt-service payments refer to actual payments of principal and interest on external public debt.
